

EMS LOOP AUTOMATIC TIMESTAMP QUICK REFERENCE GUIDE

- When an automatic timestamp is triggered an automatic timestamp dialog will be displayed with a 10 second countdown the timer.
- If you cancel an automatic timestamp the crew must complete that timestamp manually! Once an automatic timestamp has been canceled, EMS Loop will NOT prompt for automatic timestamp again for that specific status of the trip. Auto timestamping prompts will continue with the next status.
- At Scene and At Destination automatic timestamps are triggered when you are within 100 meters of the pickup or drop off address Latitude / Longitude.
- En Route, Transporting and Complete are triggered when you reach 7 miles per hour and travel more than 100 meters from the pickup or drop off address of the trip.
- Patient contact and patient handoff timestamps are still a crew responsibility! EMS Loop can not determine if you have made patient contact or patient handoff.
- If the automatic timestamp triggers are firing at the wrong time at pickup or drop off facilities, please contact your system administrator so they can update the location of those specific facilities in the map.
